This edition offers us a close-up view of the geography, infrastructure and public space transformation in the Madrid Río project.

It points out the importance of the urban transformation of the Manzanares River, which, up to date, is one of the best leisure, entertainment and physical recreation center.

It is structured into six sections that show the different ways to integrate the river in the city center. It is compared with similar cases such as those of Berlin, Seoul and Boston.

It includes several charts, maps and stunning color photographs that offer us a spectacular view of the river’s metamorphosis as we discover how this project has changed the city and the life of its citizens.
